**ABSTRACT**

The stem bark of *V. pubescens* Vahl has been used as a traditional medicine in Indonesia. Isolation of the stem bark of *V. pubescens* Vahl with some column chromatography techniques led to obtaining the lactone diterpenoids, neoandrographolide (1), andrographolide (2), 14-deoxyandrographolide (3), and a pentacyclic triterpenoid compound, betulinic acid (4). Neoandrographolide (1) was reported in this plant for the first time. Cytotoxic activity of compounds 1-4 showed inactivity against HeLa (MTT assay).

**Keywords:** Cytotoxic, *V. pubescens* Vahl, 14-Deoxyandrographolide, Andrographolide, Neoandrographolide, Betulinic Acid.

**INTRODUCTION**

*Vitex* genus consists of 300 species distributed in the tropics and sub tropics¹. This genus is rich in organic compounds, some of which are flavonoid, terpenoid, ecdysteroid, and iridoid glucoside². Many of them have interesting biological activities, such as anticancer³-⁵, antiinflammation⁶,⁷, antioxidant⁸, antimicrobial⁹, antitrypanosomal¹⁰, antilarvaside¹¹, and antituberculosis¹².

*V. pubescens* Vahl is one of the *Vitex* genus which grows in the Asian territorial, such as Indonesia, Malaysia, India, Sri Lanka, and the Philippines. In Indonesia, it is mainly found in Sumatra, Kalimantan, and Java island¹. *V. pubescens* Vahl is used for traditional treatment for many diseases, its leaves and stem bark are used for back pain, cut, indigestion, fever, scorpion sting, increase appetite, dysentery, antiinflammation, cancer and rhinitis, and also used to increase stamina¹³. Ecdysteroid:pinnatasterone, 20-hydroxyecdisone, turkesterone¹⁵, iridoid glucoside: pinnatoside and flavonoid:viscoside, apigenin and luteolin¹⁶ have been isolated from *V. pubescens* Vahl stem bark. Meanwhile, β-sitosterol, stigmasterol, 5-hydroxy-3, 7, 4’-trimethoxyflavone, 5-hydroxy-7,4’-dimethoxy-flavone, and 5-hydroxy-3,3’,4’,7-tetramethoxyflavone¹⁷ were also found in *Vitex pinnata* which grows in Malaysia.

Diterpenoid is the main secondary metabolites in *Vitex*. Lactone-type diterpenoid which has furan ring from C13 to C16 is considered as a specific constituent in this genus¹⁸. Diterpenoid compounds have interesting and diverse biological activities, such as 6-acetoxy-9-hydroxy-13(14)-labdan-16,15-olide, vitexilactone, rotundi-furan, vitet trifolin D, and vitet trifolin E¹⁹ which are active as anticancer agents, 9-hydroxy-13(14)-labden-15,16-olide and isoambreinolide which have antituberculosis²⁰ property and five diterpenoid compounds from *Vitex trifolia*, 4,4,8,10-tetramethyl-trans-decalin skeleton, vitexifolin E, vitexifolin F, vitexilactone, and 6-acetoxy-9-hydroxy-13(14)-labdan-16,15-olide which have good activity as antitripanosomal¹⁰.

As a part of our research on Indonesian herbal medicine potential as cytotoxic agents, in this paper will be reported the isolation and characterization of neoandrographolide (1) and its activity against cervix cancer cells (HeLa). The anticancer assay was also carried out on the three other compounds (2-4).
EXPERIMENTAL

Plant Material
The stem bark of *V. pubescens* Vahl was taken from the environment of the University of Riau, Pekanbaru, Indonesia. The plant was identified at the Andalas University Herbarium (ANDA), Biology Department, Andalas University.

Extraction and Isolation
*V. pubescens* Vahl stem bark (9.58 kg) was dried, ground, and macerated with methanol. Maceration process was carried out for three days with three repetitions. The extract was evaporated to yield methanol crude extract (532.2 g). The methanol extract was fractionated with n-hexane, dichloromethane, and ethyl acetate (EtOAc) solvent, respectively to get n-hexane extract (60.04 g), dichloromethane extract (57.82 g), ethyl acetate extract (227.79 g), and methanol extract (186.55 g).

Dichloromethane extract (57.82 g) was separated by using vacuum liquid chromatography (VLC) with solvents of n-hexane 100%, n-hexane:ethyl acetate (20%, 40%, 60%, 80%) and ethyl acetate 100%, to yield fraction A, B, C, D, E, and F.

Fraction E (16.278 g) was separated by column chromatography (silica 70-230 mesh) using eluent of n-hexane and ethyl acetate with an increase in polarity to obtain 13 fractions (fraction E₁-E₁₃). Fraction E₁₁ (1.125 mg) was purified by flash column chromatography (silica 230-400 mesh) using eluent of hexane-ethyl acetate (1:1, 4:6, 3:7, 2:8, 1:9) and ethyl acetate 100% to yield 12 fractions (fraction A₁₁₁₁-A₁₁₁₂).

Fraction A₁₁₁₁ (1.105) was purified with column chromatography (silica 230-400 mesh) with eluent DCM:EtOAc (1:1, 3:7, 0:10) to afford compound 1 (16 mg) and compound 2 (36 mg). The isolation process of compound 3 and 4 were fully explained in previous publication²¹-²³.

Cytotoxic Activity Assay
HeLa cells were cultured in RPMI 1640 media containing 10% fetal bovine serum (FBS) and 1% penicillin-streptomycin antibiotic and incubated in a CO₂ 5% incubator at 37°C for 24 hours. After 24 hours of growth, HeLa cells (1 x 10⁴ cell/mL, 100 µL) were distributed on 96-well plate, and 100 µL of the tested compound (dissolved in DMSO) was added to the well in various concentration. The mixture of HeLa cells and the tested compound was incubated for 24 hours with CO₂ 5% at 37°C. After 24 hours of incubation, 10 µL of MTT was added and allowed to stand for 4 hours. The living cells will react to MTT which produces a purple color of formazan. The MTT reaction was stopped with stopper reagent (HCl 10% in SDS), and incubated overnight at room temperature. The absorbance was then measured with ELISA reader at λ 595 nm.

Spectral Data

HMOC and HMBC: see Table-1.

RESULTS AND DISCUSSION
Extraction of dried stem bark of *V. pubescens* Vahl with methanol produced crude extract (532.2 g). It was then fractionated with n-hexane, dichloromethane, and ethyl acetate solvent, respectively. Dichloromethane fraction (57 g) was separated with VLC to yield 6 main fractions (A-F). Purification of
fraction A, C, and E produced compound 1-4 which were identified as neoandrographolide, andrographolide, 14-deoxyandrographolide, and betulinic acid. Structure determination of compound 2-4 has been described in the previous studies.\(^{21-22}\)

Compound 1 forms a white solid with a melting point of 170-171\(^{\circ}\)C. The IR spectra showed absorption for hydroxyl group, carbonyl group, and C-H aliphatic at \(\nu_{\text{max}}\) 3369, 1746 and 2927 cm\(^{-1}\), respectively. 1H NMR (Table 1) spectrum indicated several characteristics of the Compound 1. There was the presence of a vinyl group (\(\delta\)H 4.63 and 4.86 ppm, H-17), and two oxygenated methylenes (\(\delta\)H 4.82 ppm, H-15; 3.21, and 4.09 ppm, H-19). Two olefin bonds at C-14 and C-17 provided chemical shift at \(\delta\)H 63.74 ppm. The proton at C-14 showed at higher frequency (\(\delta\)H 7.34 ppm) due to conjugation effect of the carbonyl group. 1H-NMR spectrum exhibited some signals suitable for glucosil group, were identified as one oxidized methylene carbon (\(\delta\)H 3.69 and 3.85 ppm, H-6'), five oxidized methine carbones at \(\delta\)H 4.18 ppm (H-1'), 3.16 ppm (H-2'), 3.32 ppm (H-3'), 3.30 ppm (H-4'), and 3.24 ppm (H-5'). 13C NMR and DEPT data analysis (Table 1) revealed some signals for 26 carbon atoms. Two methyl carbons displayed at \(\delta\)C 15.93 ppm (C-20) and 28.41 ppm (C-18). The presence of glucosyl group was marked by several signals at \(\delta\)C 105.16 ppm (H-1'), 75.36 (H-2'), 78.33 (H-3'), 71.78 (H-4'), 77.83 ppm (H-5'), and 62.48 ppm (H-6'). Moreover, there were also found the signals for C-carbonyl (\(\delta\) 177.06 ppm, C-16), two oxidized methylene carbons (\(\delta\) 72.17, C-15 and 73.54 ppm, C-19). The presence of olefin methine carbons was marked by signals at \(\delta\)H 147.71 ppm (C-14) and one hybridized methylene sp\(^2\) at 107.36 ppm (C-17). Spectra analysis of 1H-1H COSY, HMQC, and HMBC supported compound 1 as neoandrographolide. The data of compound 1 was confirmed by the previous research\(^{23}\).

*Ref\(^{24}\)
Study of the literature showed neoandrographolide and 14-deoxyandrographolide were found for the first time in Vitex genus. Andrographolide was previously found in V. limonifolia\textsuperscript{24}, and betulinic acid was also isolated from V. trifolia\textsuperscript{25} and V. negundo\textsuperscript{26}.

Cytotoxic activity against cervix cancer cells (HeLa) was treated to 1-4. The percentage viability of isolated compounds at 25 and 50 µg/mL is displayed at Picture 1. Andrographolide (2) gave good inhibition where the viability of HeLa cells reached 72.7% at 50 µg/mL. Compound 1, 3, and 4 had no effect at this concentration. IC\textsubscript{50} value showed no potential activity of the tested compounds due to the low value of IC\textsubscript{50} (IC\textsubscript{50}<30 µg/mL)\textsuperscript{27}.

![Chemical structures](Image)

**CONCLUSION**

Three lactone diterpenoid compounds, neoandrographolide (1), andrographolide (2), 14-deoxyandrographolide (3), and a triterpenoid compound, betulinic acid (4), had been isolated from the stem bark of V. pubescens Vahl. Compound 1-4 showed no antiproliferative effect on HeLa cells with IC\textsubscript{50}>100 µg/mL.

**ACKNOWLEDGMENT**

We would like to thank Directorate General of Higher Education for the grant through BPPDN scholarship and Doctoral Dissertation Research (no. 270//UN.19.5.1.3/PP/2018). Also thank to Andalas University Herbarium (ANDA) for identifying the specimen, The Sumatera Biota Laboratory and LIPI Serpong for taking the spectra of isolated compounds.
